

Advanced Coaching Education – Final Assignment

Talent Development Framework

Dorian Spilette

Introduction

This document presents my Talent Development Framework (TDF) for the junior department of a badminton club.

As head coach, I am responsible for 300 junior players and a coaching team of 10 coaches. The goal of this framework is to create a clear and shared reference for the whole coaching team.

The framework will relate to our 3 core values : **Sharing**, **Education** and **Autonomy**.

1 Purpose of the Talent Development Framework

A Talent Development Framework gives the coaching team a common direction. It helps us define what we want to develop in players at each stage of their development.

With 10 coaches working with many different players, it is important that everyone follows the same general principles. This creates a more coherent, safe, and meaningful development journey for the players.

Limitations of the TDF

The TDF should be used as a reference point, not as a fixed truth.

Because **autonomy** is one of our core values, coaches are encouraged to adapt the framework to the needs of their players. Each group is different, and each player has individual needs. The coach should therefore use the TDF with flexibility and good judgment.

The players should also be involved in this process. When possible, they should be encouraged to express their opinions, make choices, and take ownership of their development.

The TDF also reflects our value of **sharing**. Coaches should regularly discuss how they use the framework in practice. As a coaching team, we will share examples, ideas, and adaptations in order to learn from each other.

Finally, the TDF will continue to evolve. Through experience, reflection, and continuous **education**, the coaching team will improve the framework over time.

2 Structure of the Framework

The framework is organised around three development stages used in badminton development:

- **Sampling Phase:** 6–12 years old
- **Specialising Phase:** 13–15 years old
- **Investment Phase:** 16–19 years old

For each stage, the framework covers both on-court and off-court topics. Because the BWF Badminton Coach Education Level 3 already provides a TDF, this framework will focus on

adding new points or highlighting existing ones that I consider especially important. It does not aim to repeat everything that is already available in the public TDF.

2.1 Principles Common to All Development Stages

Some principles are important in every development stage. They should be present from the youngest players to the oldest players. They are discussed here instead of being repeated in every development stage.

2.1.1 Psychological Development: Motivation

At every stage, we should aim to develop intrinsic motivation. A player who is intrinsically motivated is more likely to enjoy badminton, stay committed, train with quality, and keep improving.

To support intrinsic motivation, the training environment should develop three psychological needs from self-determination theory:

- **Competence:** the player feels capable and sees progress.
- **Autonomy:** the player has choices and feels involved.
- **Relatedness:** the player feels connected to the group, the coach, and the club.

2.1.2 Psychological Development: Sharing Expertise

We often think that the more advanced a group is, the less we should use games. I do not agree with this idea.

Games should be included at every level through communities of practice. On one hand, this fosters relatedness, which is required for intrinsic motivation. On the other hand, communities of practice encourage players to share their expertise, which supports our core value of sharing.

We should also remember that badminton should be fun. A challenging training environment can still be enjoyable.

2.1.3 Tactical Development: Always Having a Choice

If autonomy means being able to make choices and take responsibility for them, then tactics are a key part of autonomy in badminton. During a rally, the player must constantly choose what to do, where to move, and which stroke to use.

For this reason, technical, physical, and psychological work should always include a tactical element. Players should not only learn how to perform a skill. They should also learn when, why, and how to use it in a game situation.

Behind every exercise, there should be a clear purpose and a meaningful choice for the player.

2.2 Sampling Phase: 6–12 years old

Topic	Priorities
Technical	• Develop racket skills: adjust the grip and make the racket feel like an extension of the body. • Develop hitting skills under predictable rallying conditions: • Front court: net shots, lifts, delayed lifts. • Mid court: blocks, drives. • Back court: clears, smashes, dropshots, slices.
Tactical	• Help players understand that badminton is not about simply sending a “hot potato” to the other side. Every stroke should have a clear purpose: introduce the first tactical choice through the decision between a net shot and a delayed lift. Purpose = Autonomy! • Deception gives clear visual feedback when it works. • Deception is played with a strong purpose and helps players understand how to use the depth of the court. • Deception is fun and motivating for young players. • Understand how to use base position and different strokes to cover and exploit the height, width, and depth of the court. • Understand simple game plans based on these concepts. • Recognise situations of advantage and disadvantage. • Recognise simple patterns that can be anticipated.
Mental	• Commitment: focus on the process more than the result. Fun should come from developing new skills and trying hard, not only from winning. • Develop positive thinking and self-esteem. • Learn to celebrate successes and efforts. • Cohesion: develop the ability to work with others. • Learn to interact during communities of practice. (Sharing with peers).
Physical	• Focus more on basic motor skills, such as running, throwing, receiving, and jumping, rather than badminton-specific motor skills. • Develop balance in predictable sequences. • Develop fine motor skills: fast hands, fast feet. • Learn to combine different movements; be at ease moving through different planes. • Introduce basic bodyweight strengthening with correct technique.
Off-court	• Children are not yet fully autonomous. Parents should be involved so they are willing to support travel, competitions, and regular practice, while keeping clear boundaries. • Coaching: Keep practice fun and varied. The coach should create many different experiences so players can adapt, explore, and develop broad general skills. • Life skills: learn to respect rules of behaviour.

2.3 Specialising Phase: 13–15 years old

Topic	Priorities
Technical	• Develop consistent and varied hitting skills in matchplay. In addition to the strokes mentioned in the sampling phase: • Front court: spin net shots, cross net shots, deceptive net shots, kills, deceptions. • Mid court: lifts. • Back court: slices/reverse slices, pulled shots, backhand clear. • Develop varied movement patterns to cover different areas of the court.
Tactical	• Adaptability: adjust the game plan based on the opponent and the evolution of the match. • Understanding of advantage, disadvantage, and neutral situations: make sensitive stroke and movement choices based on this context during matchplay. • Exploit deceptions to gain an advantage. • Develop anticipation skills through a good understanding of tactical “rules of thumb” and the different zones: adapt court positioning and feet orientation. • Exploit the height, depth, and width of the court, as well as the speed and changes of speed in the rally.
Mental	• Commitment: set and work toward your own goals. Keep an emphasis on process goals. • Respond to the stronger need for individuality: foster uniqueness and embrace differences between players. This helps develop more confidence and autonomy. • Share expertise during communities of practice and develop the ability to take leadership when needed.
Physical	• Ability to compete at 100 percent speed and quickness against peers. • Ability to move fluently to all areas of the court while keeping balance in unpredictable sequences. • Integrate elements aimed at developing stamina in training.
Off-court	• Life skills: become more autonomous in your badminton journey. Prepare your own bag, and plan and follow annual competition and training programmes with guidance. • Coaching: keep practice fun. Encourage creativity, especially with girls. • As the player transitions from multi-sport to single-sport participation, help them making choices.

2.4 Investment Phase: 16–21 years old

Topic	Priorities
Technical	• Focus on improving hitting skills based on individual requirements: • The specific event the player specializes in. • Identified as necessary for personal development. • The same idea applies to movements: at this stage, a lot of differentiation is required, which increases the player's autonomy.
Tactical	• Adaptability: Ability to create plans, implement them, and adjust them during a game, both independently and with input from coaches. • Great understanding of one's own game: • Cover weaknesses and leverage strengths during matches. • Self-evaluations to identify development areas.
Mental	• Commitment: Set and work toward one's own outcome goals. • Able to participate actively and collaborate in a team environment, including with coaches, managers, psychologists, etc. • Emotional maturity: maintain concentration in a variety of practice situations and remain emotionally stable under pressure.
Physical	• Focus on badminton-specific movements. The movements should be varied, and the player should be able to handle them at speed, with balance, and in unpredictable sequences. • Follow individual training programmes for different physical components: • Strength in all areas of the body. • Stamina. • Suppleness. • Rehabilitation if injured. • The player is educated regarding these programmes, allowing him to perform them with good technique while understanding the purpose of each session. Since these sessions are not directly related to tactics, their purpose may not always be obvious, so the player needs to understand why they are important.
Off-court	• The player becomes fully autonomous and takes full ownership of managing commitments. • Maintains and develops positive habits regarding sleep, nutrition, travel phases, and periods of injury. The player is educated regarding these subjects. • If injured, is able to adapt practice and help with coaching by sharing expertise.

3 Conclusion:

This Talent Development Framework, adapted from the BWF TDF, aims promoting the three core philosophical values: **Sharing**, **Education**, and **Autonomy**.

Sharing is represented through the emphasis placed on communities of practice, collaboration, and the ability to participate actively in a group environment. Players are encouraged to share their experiences, learn from others, and contribute to the development of their peers.

Autonomy is developed by giving players meaningful choices throughout their development. This is reflected in the strong emphasis on tactical understanding at every stage. Autonomy is also supported by allowing flexibility in the content of training, so that coaches can adapt the framework to the specific needs, profiles, and goals of each player.

Education becomes increasingly important as players progress through the development stages. This is especially true in areas that are less directly connected to tactics, such as nutrition, recovery, sleep, injury management, and individual physical programmes. In tactical sessions, the purpose of the work is often visible through the game situation itself. However, in strictly mental or physical sessions, the purpose may be less obvious to the player. Education is therefore essential to make these sessions meaningful and to keep the player engaged and responsible for his development.
